TITLE: Means of using recencephalography in neurology [This paper was presented at the meeting of Slovak neurologists at Medra-Harmonia, 25-27 June 64.]

SOURCE: Ceskoslovenska neurologie, no. 3, 1965, 239

TOPIC TAGS: neurology, encephalology, brain, nervous system disease, circulatory system disease, clinical medicine

ABSTRACT: Recencephalography (REG) is a simple method that offers an estamination method not burdening the patient. It is suitable for investigation of the hemodynamics of the brain. Simultaneous REG and REG offer special advantages. To healthy subjects and 30 neurological patients were investigated by the method; the results are discussed. Arteriosclerisis if the brain and of the train-supplying arteries can be diagnosed easily by this method. [JFRE]

636. ZOULA J. Praha-Podoli. \*Vylucovaní amino a při parenterálním podávaní Kašeinových hydrolysatů. The excretion of amino-acid nitrogen following parenteral àdministration of casein hydrolysate CSL. PEDIAT. 1955, 10/4 (281-286) Graphs 1

Casein hydrolysate was administered parenterally by i.v. infusion (4-6 drops/min.) to 6 children - 3 with gastroenteritis and 3 premature infants - in a total amount of 100-400 ml. (i.e. 5-20 g. of dry preparation), according to the weight of the child. The levels of free amino nitrogen, urea and uric acid in urine and thu changes in protein fractions of blood serum by filter paper electrophoresis were investigated. A portion of administered nitrogen (10-15%) was excreted in the urine in the form of amino nitrogen. The highest levels of amino nitrogen were observed during the infusion, and 2 to 4 hr. later feli to normal again. Parallel with this the levels of urea and uric acid rose, but their return to normallevels was slower (in 13-20hr.) Qualitative alteration in excreted amino-acids was observed only during in infusion. After the infusion all amino-acids not normally found in the urine rapidly disappeared. It was found that infusion of casein has no significant influence on serum protein fractions.

Title : A Discussion Concerning the Exploitation and

Life of Pot Furnaces.

Orig Pub: Sklar a keramik, 1958, 8, No 4, 117-118.

Abstract: It is pointed out that most frequent cause in disrupted operation of pot furnaces is the destruction of burners — the most strained part of the fire-box. The results of temperature measurements in various sections of a twelve-pot furnace are given as well as the analysis of the mixture of generator and heating gases fed to the burner.

of the kiln. Various methods are descrobed for firing the batch (manual and semiautomatic). The composition of the firing gases and their caloricity, is cited as well as data concerning the temperature and its distribution in the kiln space, and inspection of the thermal condition and draft of the kiln.

IV. An investigation of kilns was conducted from the point of view of their capacity; that is, the volume of the vessel and of the area of the kiln hearth corresponding to it. Six types of potters' kilns of the Simens system and one of the type of the Knoblaukh systems are established. The following claims are made for these types of potters' kilns: uniform technical and economic indices; minimum expense in the construction and reconstruction of kilns; somplification of

TITLE: Borehole refraction method

SOURCE: Ceskoslovenska akademie ved. Geofysikalni ustav. Geofysikalni sbornik, v. 12, 1964. Prague, 1965. Prace, no. 196-214, 199-224

TOPIC TAGS: seismic prospecting, refracted wave, seismic logging borehole logging, ACOUSTIC REFERCTION, SEISMIC CURVE

ABSTRACT: The paper presents a method of interpreting measurements using a geophone located in a borehole below the refraction interface for recording waves excited on the surface. For the sake of brevity, this was called borehole refraction method. The paper deals primarily with numerical methods permitting the coordinates of the corresponding refraction point on the interface to be calculated from the field of ray times. Both the direct and the inverse problem were solved for a plane interface with inclination \$\phi\$, as well as some methods of calculating the relative elevations with respect to the comparative horizontal

ACC NR: AT6016647

level. These methods give only approximate results. The calculation of the depth corrections and corrections for the displacement of the point (vector displacement) is intended primarily for relatively small elevations from the comparative level. As exemplified on models in the paper, even when the elevations are large, relatively satisfactory results are obtained by using relations  $(p = (z_0 - \Delta z)v_1/\sqrt{(\overline{v}^2 - v_1^2)})$  or ( $\Delta z = \Delta t$  . K.). These methods are intended for quick evaluation of the results during the actual work so that the measurements can be supplemented where required. For the final treatment of the results, a numerical method is elaborated which permits the calculation of the coordinates of the refraction point if the ray time, the values of the apparent velocity, and the slope of the displacement vector (normal to isochrone) are known. The appropriate values are best obtained from the ray-time field by using a square network of points. The method is analogous to the graphical method of solving this problem according to L. M. Gardner: [Seismograph Determination of Salt-Dome Boundary Deep on the Dome Flank. Geophysics, 14 (1949), 29]. The advantage of this method is that it eliminates the necessity for three-dimensionality. A disadvantage is that in the first medium the velocity is considered to be constant and not variable with depth z. The three-dimensional solution by the graphical method using A. W. Musgrave, V. C. Wodley, H. Gray: [Outlining Salt Masses by kefraction Methods. Geophysics, 25 (1960), 141] . permits

L 36115-66

ACC NR. AT6016647

the use of wavefront charts which consider given velocity conditions. When interpreting the travel-time curves constructed from usammed ray times, we consider only the first arrival. The type of wave recorded is not known exactly. The inverse problem will be made more difficult, particularly by the diffracted waves appearing in the first arrivals. The effect of the irregular configuration of the interface on the type of travel-time curves of the different waves was studied on several models representing a horst and a graben. It is clear from the inverse problems that the occurrence of diffracted rays greatly interferes with continuous study of the interface. The data on diffracted waves obtained from the models studied can then be applied in real measurements. For a more detailed study it would be more advantageous to carry out laboratory model measurements for different types of interface configuration. This would permit a study not only of the kinematic but also of the dynamic characteristics for distinguishing different types of waves. Better interpretation would contribute to the study of later wave arrivals. Orig. art. has: 15 figures and 12 formulas. [Author's abstract] [KS]

A contactless polarized relay

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 9, 1962, abstract 9-2-18 d (Ozech. pat., cl. 21 g,

4/05, no. 99014, March 15, 1961)

The patented circuit of a transistorized contactless relay has two transistors connected in series to the supply voltage, each base being connected through a resistor to the collector of the opposite transistor. The input signal is applied to the bases of the transistors and the output is taken between the mid-point of the supply source and the junction point of the transistors. Revere biassed Zener diodes are connected in series with the load. 2 firgures. / Abstracter's note: Complete translation. /

Determined that the speed of the reaction of oxidizing liquid mixtures of organic compounds by air depends on the nature of the mixture. Pure compounds were found to oxidize much slower than their mixture forms. Show that molecular compounds formed in binary systems are all satisfied by single point on the graph curve representing the induction period. Seven compounds representing three binary systems were studied.

TRIVING ROADS TO THE KIP, USING SKIPS. Zoyta A.S. (Ugol, Dec. 1948, (12), 22-23). An experiment designed to investigate the possibility of increasing loading efficiency by the use of skips in an inclined road was made in the "Sofia" seam (thickness 1 m., angle of dip, 10-16") at the "Kapitalnaia" mine). The y consits of a regtangular iron box, its front and being open and out off at am angle to the horizontal. The wheels of the usual mine car type, are set loosely on pegs festened to the side walls. The haulage rope is attached to a frame consisting of 2 drawing bars fastened to the side walls by bolts near the back wheels. The skip which is 1.7 m. long, 1.05 m. wide and 0.5 m. high, weight 500 k.g. and is capable of lifting 1200 k.g. of material. The rear wheels are spaced further apart than the front wheels, and correspondingly, there are two sets of rails. The inner set flattens out on the discharge platform, the wider set starting at the same roint. Thus when the front wheels run level on the discharging platform, the back whoels must follow the inclined rails, and in this way all the contents of the skip are discharged into the mine car. In order to stop the advance of the skip the ends of the inclined rails are bent upwards above the centre of the platform. The level of the latter is 1.6 m. shove the floor A REFREEURGICAL LITERATURE CLASSIFICATION
